## Section I

### GENERAL INFORMATION

#### 1.1 EQUIPMENT DESCRIPTION

The TFT Model 923 AM Modulation Monitor is intended for continuous modulation monitoring of an AM transmitter operating in the 500 kHz to 40 MHz frequency range to enable the station to comply with the requirements of Section 73.56 of FCC Rules and Regulations. The Monitor requires a minimum 1-volt rms RF input from the monitored transmitter. No tuning is required at the Monitor.

Features include:

- Flasher to indicate 125% positive modulation peaks.
- Adjustable flashers to indicate positive modulation peaks from 50% to 150% .
- Adjustable attenuator for reading residual noise and low modulation percentages on modulation meters.
- Linear phase filter design, eliminating overshoot on complex audio waveforms.
- Wide audio bandwidth, allowing distortion measurements on high frequency modulation.
- Internal calibration circuit which digitally synthesizes a modulated carrier for both +125% and -100% modulation to check the modulation meter and peak flashers.

An optional, tunable RF Preselector can be installed in the Monitor for off-the-air monitoring of signals in the 500 to 1990kHz range. Figure 1.1-1 is a basic block diagram of the equipment.

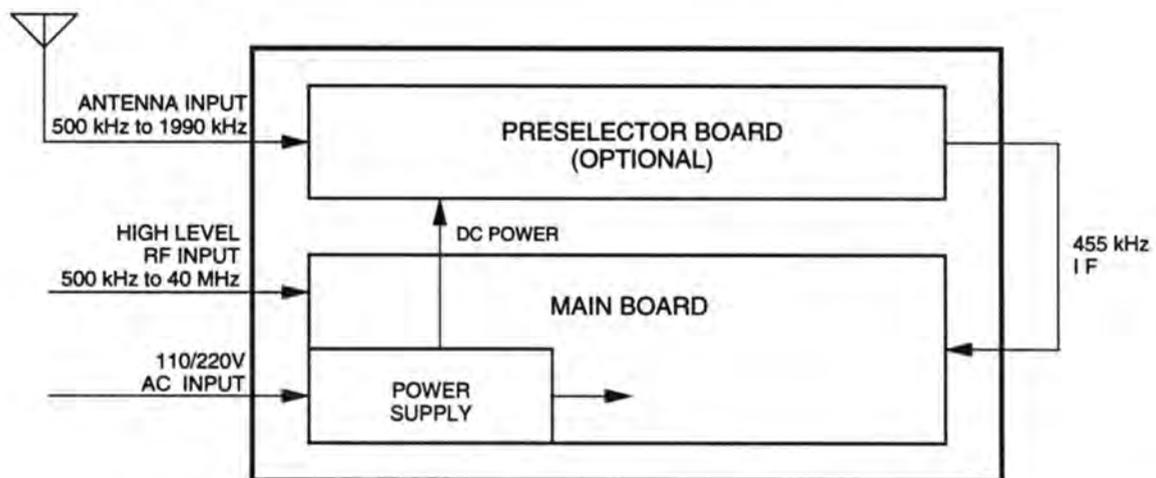

Figure 1.1-1. TFT Model 923 AM Modulation Monitor - Basic Block Diagram

## 1.2 SPECIFICATIONS

### RF INPUT, WIDE BAND DEMODULATOR

Frequency Range . . . . .	500 kHz to 40 MHz
High-Level RF Input . . . . .	1 V to 5 Vrms
Impedance . . . . .	50 ohms

### MODULATION METER/TEST/RIGHT

Meter Range . . . . .	0 to 133% with "dB" scale for measurement of positive modulation or the right channel.
Attenuator Range . . . . .	0 to -50 dB in 10 dB steps
Accuracy . . . . .	$\pm 2.0\%$ at 100% modulation, sinusoidal test tone 400 Hz
Frequency Response . . . . .	50 Hz to 15 kHz $\pm 2.0\%$ , 30 Hz to 25 kHz, $\pm 5.0\%$

### MODULATION METER/LEFT

Meter Range . . . . .	0 to 133% and "dB" scale for monitoring negative modulation or the left channel
-----------------------	---

### PEAK MODULATION INDICATORS

125% Peak Indicator . . . . .	Internally set to flash when modulation exceeds +125%
Variable Peak Indicator . . . . .	Set by the front panel 3-digit switch in 1% steps from 50% to 150% on both positive and negative peaks
Accuracy (400 Hz Tone) . . . . .	2% at 98% modulation
Frequency Response (high level RF input) . . . . .	$\pm 3\%$ , 50 Hz to 15 kHz at 98% modulation
Response Time Accuracy . . . . .	Approximately 10 cycles of 10 kHz

## MODULATION CALIBRATOR

Type: ..... Built-in modulation calibrator generates a "-" 100%, "+" 125% AM modulated carrier which is switched into the detector input by the front panel "CAL" button

Accuracy .....  $\pm 1.0\%$

### Audio Outputs, Rear Panel

Impedance ..... 600 ohms. balanced, 5k ohms unbalanced

Balanced Output Level ..... 0 dBm (.775 Vrms)

Unbalanced Output Level ..... 5 Vrms

THD ..... 0.15% typical, 0.25% max at 99% modulation, 400 Hz tone

Signal-to-noise Ratio .....  $> 75$  dB Below 100%  
(high level RF input)

Transient Response .....  $< 1.0\%$  overshoot  
(high level RF input)

Baseband Frequency Response .....  $\pm 0.5$  dB, 20 Hz to 25 Hz

### ALARM OUTPUT

Relay contact closures for activation of an external alarm upon loss of modulation or carrier.

### PHYSICAL AND ENVIRONMENTAL

Size ..... 19" W x 5 1/4" H x 14" D

Weight ..... 25 lbs. shipping weight

Power: ..... 115/230 VAC, 50/60 Hz, 30 watts maximum

Operating Temperature .....  $0^{\circ}$  to  $50^{\circ}$ C

### 1.3 WARRANTY

TFT inc.warrants each of the instruments of its manufacture to be produced to meet the specifications delivered to the BUYER; and to be free from defects in material and workmanship and will repair or replace, at its expense, for a period of one year from the date of delivery of equipment, any parts which are defective from faulty material or poor workmanship.

Instruments found to be defective during the warranty period shall be returned to the factory with transportation charges prepaid by BUYER. It is expressly agreed that replacement and repair shall be the sole remedy of BUYER with respect to any non-conforming equipment and parts thereof and shall be in lieu of any other remedy available by applicable law. All returns to the factory must be authorized by the SELLER, prior to such returns. Upon examination by the factory, if the instrument is found to be defective, the unit will be repaired and returned to the BUYER, with transportation charges prepaid by SELLER.

Transportation charges for instruments found to be defective within the first (30) days of the warranty period will be paid both ways by the SELLER.

Transportation charges for warranty returns, wherein failure is found not to be the fault of the SELLER, shall be paid both ways by the BUYER.

This warranty does not apply to instruments which, in the opinion of the SELLER, have been altered or misused.

NO OTHER WARRANTY IS EXPRESSED OR IMPLIED. TFT IS NOT LIABLE FOR CONSEQUENTIAL DAMAGES.

#### 1.4 CLAIMS FOR DAMAGE IN SHIPMENT

Your instrument should be inspected and tested as soon as it is received. The instrument is insured for safe delivery. If the instrument is damaged in any way or fails to operate properly, file a claim with the carrier, or if insured separately, with the insurance company.

WE SINCERELY PLEDGE OUR IMMEDIATE AND FULLEST COOPERATION TO ALL USERS OF OUR PRECISION ELECTRONIC INSTRUMENTS.

PLEASE ADVISE US IF WE CAN ASSIST YOU IN ANY MANNER

TFT, Inc.  
3090 Oakmead Village Drive

## Section II

### INSTALLATION

#### 2.1 UNPACKING AND INSPECTION

Upon receiving the instrument, inspect the packing box and instrument for signs of possible shipping damage. Operate the instrument in accordance with the procedures of Section 3 of this manual. If the instrument is damaged or fails to operate properly, file a claim with the transportation company or with the insurance company, if insured separately.

#### 2.2 POWER REQUIREMENTS

The Model 923 is factory wired to operate from either a 117-volt or a 230-volt AC source. The line frequency must be 50/60 Hz. Maximum power required is 30 watts.

#### 2.3 INSTALLATION

- a. Mount the instrument in the equipment rack.
- b. Plug the line cord into an appropriate power source (see Section 2.2 above)
- c. Turn the front panel level INPUT LEVEL control (Figure 3.3-1, Item 3) fully counterclockwise.

#### CAUTION

Do not connect the cable to rear panel HIGH LEVEL RF INPUT connector until the INPUT LEVEL control is turned fully counterclockwise. Also, make sure that the RF input from the transmitter is no more than 5V rms before connecting the cable to the HIGH LEVEL RF INPUT connector.

- d. Connect the cable from the high-level modulated sampling point on the transmitter, or from the antenna common point sampling loop, to the rear-panel HIGH LEVEL RF INPUT connector.
- e. Connect all other rear-panel terminals that are used. Refer to Section 3.3.2 for descriptions of the use of the various outputs.
- f. Turn the INPUT LEVEL control clockwise until the INPUT LEVEL "SET" LED is on.

## Section III OPERATION

### 3.1 GENERAL INFORMATION

The Model 923 AM Modulation Monitor displays the modulation percentage of the carrier being monitored. Both positive and negative modulations can be selected for monitoring. A front panel LED flashes when the modulation percentage exceeds 125 percent on positive peaks. A pair of front-panel LEDs flashes when the modulation percentage exceeds a preset limit. Both positive and negative peaks can be monitored at the same time.

The Monitor can also be used to measure residual noise on the carrier and modulation percentage of low-level modulation.

### 3.2 TURN-ON AND WARM-UP

The monitor contains no on-off switch, and is on whenever it is plugged into an appropriate power source. Since the instrument is completely solid-state, a warm-up of no more than 5 minutes is sufficient for it to achieve its rated accuracy.

### 3.3 CONTROLS, INDICATORS AND CONNECTORS

Front and rear panel controls, indicators and connectors are shown in Figures 3.3-1 and -2. The functions of these items are listed in Tables 3.3-1 and -2.

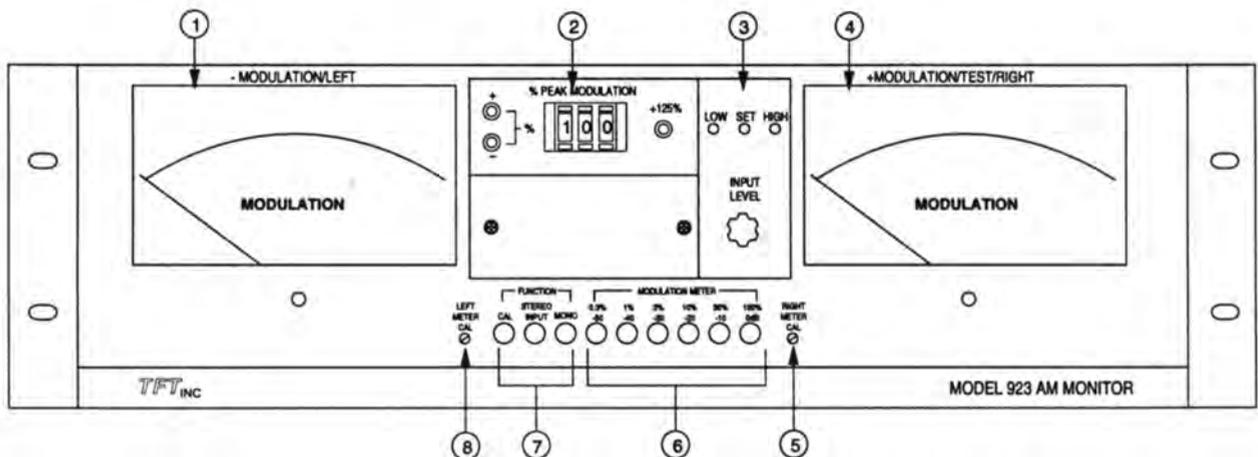

Figure 3.3-1. Front Panel Controls and Indicators

Table 3.3-1. Front Panel Controls and Indicators

ITEM	NAME	FUNCTION														
1	-MODULATION/LEFT	Analog meter. Indicates negative modulation percentage of carrier being monitored as described in Section 3.4.														
2	% PEAK MODULATION	<p>3-digit pushwheel switch and 3 LEDs. Used to indicate that a modulation peak has exceeded a reference level selected via the MODULATION METER switches (Item 6).</p> <p>The LEDs can respond to fast transients and peaks that the MODULATION meters cannot.</p> <p>The pushwheel switches should be set to the desired modulation reference modulation percentage. The ± % LED pair will then flash when modulation peaks exceed the selected reference.</p> <p>The + 125% LED will flash when modulation exceeds 125% regardless of the setting of the pushwheel switches.</p>														
3	INPUT LEVEL	<p>Three LED indicators and one potentiometer control. Used to adjust the carrier input level from the transmitter as described in Section 2.3. The indicator can also be used to observe changes in carrier power during modulation. SET LED lights when input signal level is correct. LOW LED lights when input level is too low. HIGH LED lights when input level is too high.</p>														
4	+ MODULATION/TEST/ RIGHT	<p>Analog meter. Indicates positive modulation percentage of carrier being monitored as described in Section 3.4. The scale to be read depends on which MODULATION METER attenuation switch (Item 6) is depressed, as follows:</p> <table border="0"> <thead> <tr> <th>Modulation Meter Switch</th> <th>Applicable Meter Scale</th> </tr> </thead> <tbody> <tr> <td>100% (0 dB)</td> <td>Top scale</td> </tr> <tr> <td>30% (-10)</td> <td>Middle scale</td> </tr> <tr> <td>10% (-20)</td> <td>Top scale + 10</td> </tr> <tr> <td>3% (-30)</td> <td>Middle scale + 10</td> </tr> <tr> <td>1% (-40)</td> <td>Top scale + 100</td> </tr> <tr> <td>0.3% (-50)</td> <td>Middle scale + 100</td> </tr> </tbody> </table> <p>The + MODULATION meter is also use to indicate residual noise, as described in Sec.3.6. Residual noise in dB referenced to 100% modulation is the sum of the reading on the lower meter scale and the dB label on the depressed MODULATION METER switch.</p>	Modulation Meter Switch	Applicable Meter Scale	100% (0 dB)	Top scale	30% (-10)	Middle scale	10% (-20)	Top scale + 10	3% (-30)	Middle scale + 10	1% (-40)	Top scale + 100	0.3% (-50)	Middle scale + 100
Modulation Meter Switch	Applicable Meter Scale															
100% (0 dB)	Top scale															
30% (-10)	Middle scale															
10% (-20)	Top scale + 10															
3% (-30)	Middle scale + 10															
1% (-40)	Top scale + 100															
0.3% (-50)	Middle scale + 100															

Table 3.3-2. Front Panel Controls and Indicators (Continued)

ITEM	NAME	FUNCTION
5	RIGHT METER CAL	Screwdriver-adjust potentiometer. Used for calibrating +MODULATION meter as described in Section 3.4.
6	MODULATION METER	Set of six interlocked pushbutton switches. Each switch selects an attenuator to set the scale of the +MODULATION/TEST/RIGHT meter (Item 4)
7	FUNCTION	Two interlocked pushbutton switches (MONO and STEREO INPUT) and one alternate-action pushbutton switch (CAL) used as follows:  <div style="display: flex; justify-content: space-between;"> <div style="width: 30%;">MONO</div> <div>Used for monitoring AM Monaural broadcast programs only.</div> </div> <div style="display: flex; justify-content: space-between;"> <div style="width: 30%;">STEREO INPUT</div> <div>Reserved for future use.</div> </div> <div style="display: flex; justify-content: space-between;"> <div style="width: 30%;">CAL</div> <div>On-off control of modulation calibrator. Use of the calibrator is explained in Section 3.5.</div> </div>
8	LEFT METER CAL	Screwdriver-adjust potentiometer. Used for calibrating -MODULATION meter as described in Section 3.4.

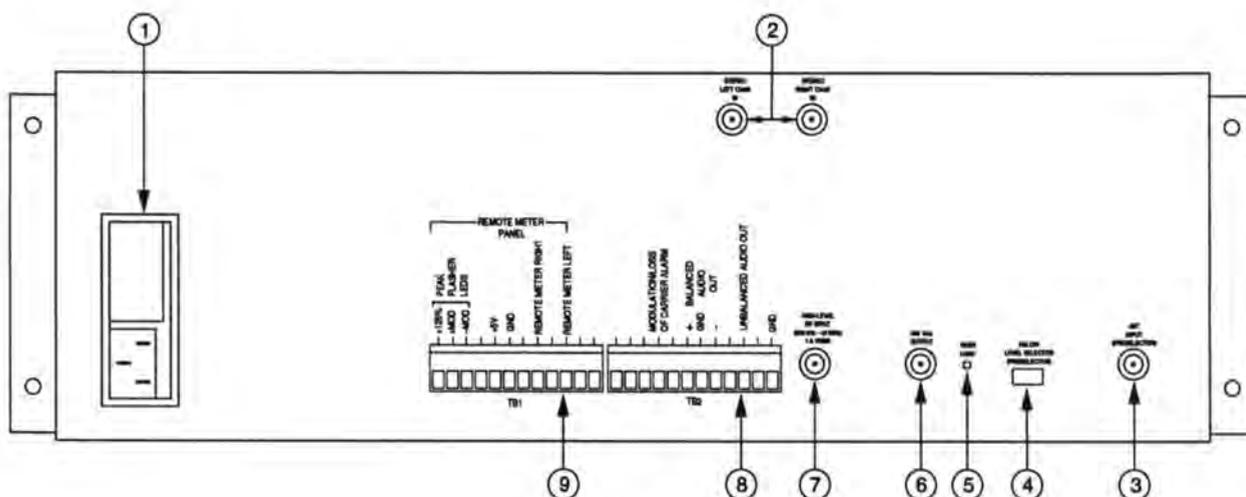

Figure 3.3-2. Rear Panel Controls, Indicators and Connectors

Table 3.3-2. Rear Panel Controls, Indicators and Connectors

ITEM	NAME	FUNCTION
1	(none)	Houses the power fuse, power line noise filters and input voltage selector for 115 or 230VAC.
2	STEREO LEFT CHAN IN RIGHT CHAN IN	Two BNC input connectors reserved for future usage.
3	ANT INPUT (PRESELECTOR)	BNC Connector. Used to connect an antenna to the RF Preselector when this option is installed.
4	HI/LOW LEVEL SELECTOR (PRESELECTOR)	2-position slide switch. Effective only with RF Preselector is installed. In the HI position, a 20 dB attenuator is inserted in the input line. LOW position is for RF input levels of 0.1 to 10 mVrms. HI position is for RF input levels of 10 to 50 mVrms.
5	OVERLOAD	LED. Effective only when RF Preselector is installed. Lights when RF input is too high for proper operation. The RF input level can be reduced by 20 dB by changing position of the HI/LOW Selector (Item 4) to HIGH
6	455 kHz OUTPUT	BNC connector. Used to connect RF Preselector output to Model 923 RF input.
7	HI-LEVEL RF INPUT 500 kHz - 40 MHz 1-5 VRMS	BNC Connector: Provides a means for introducing transmitter carrier through a 50-ohm cable. Maximum voltage is 5 Vrms.
8	TB2	Terminal Board. This board carries the following output terminals: <b>Loss of Carrier Alarm.</b> Terminals (Pin 4 and Pin 5). When RF input drops below a preset level, this pair of terminals provides contact closures that can handle up to 2 amperes at up to 28 VDC. <b>Modulation Alarm.</b> Terminals (Pin 4 and Pin 5). When the modulation on the monitored carrier drops below 10% for a preset time period, this pair of terminals provides contact closures that can handle up to 2 amperes at up to 28 VDC. <b>Balanced Audio Output.</b> Terminals (Pin 6 through 8). These terminals provide 2.2 Vp-p modified 75 $\mu$ sec AM Standard de-emphasized, balanced audio output across a 600-ohm load. <b>Unbalanced Audio Output.</b> Terminals (Pin 10 and Pin 11). This pair of terminals provides 14 Vp-p, modified 75 $\mu$ sec AM Standard de-emphasized unbalanced audio output across a 5 k-ohm load.
9	TB1	Terminal Board. Provides flashers and metering data for future Remote Meter Panel.

### **3.4 MODULATION MEASUREMENT USING MODULATION METER**

The + and - MODULATION Meters give a quasi-peak indication of positive and negative peak modulations, respectively. For maximum accuracy, the Modulation meters calibration should be checked regularly and adjusted if necessary. The meters are calibrated by depressing the CAL FUNCTION and the MODULATION METER 100% pushbuttons. If the MODULATION meter reading is not exactly 100%, adjust the LEFT METER CAL (Figure 3.3-1, Item 8) until it is. If the MODULATION meter reading is not exactly 125%, adjust the RIGHT METER CAL.

### **3.5 MEASUREMENT OF MODULATION USING PEAK INDICATORS**

The peak flasher are intended to catch fast transients and peaks that the meter cannot respond to. The +125% flasher operates regardless of the settings of other front-panel switches, and indicates when the positive modulation peaks exceed 125%.

To use variable PEAK flashers, set the pushwheel switches to the desired modulation percentage. The variable Peak flasher will then indicate when the modulation exceeds to the preset value in the selected direction.

Accuracy of the peak flashers should be checked regularly, as follows. Depress the FUNCTION CAL button; the +125% flasher should light regardless of the pushwheel settings. With the FUNCTION CAL switch depressed and the pushwheel switches reading 100, the PEAK flasher should be on, at 101% it should be off.

### **3.6 MEASUREMENT OF RESIDUAL NOISE**

Residual noise on the transmitter carrier of up to 40 kHz can be read to an accuracy of 1 dB, and noise of up to 70 kHz can be read to 2 dB. Thus residual sideband measurements can be made on transmitters using newer modulated techniques that might produce unwanted high-frequency spurs.

To read residual noise, turn off the transmitter modulation. Starting with 0 dB MODULATION METER switch, depress each switch in turn until a reading is obtained on the +MODULATION meter. The residual noise in dB below 100% modulation is the algebraic sum of the lower-scale meter reading on the +MODULATION meter and the value of the MODULATION METER switch depressed. Residual noise measurements should be made with monitor reading positive peaks.

An alternate method of using measuring residual noise that does not require turning off transmitter modulation is to depress the MODULATION METER switch that has been found to give a suitable meter reading for the expected value of residual noise. Although the meter will read off-scale during normal modulation, it will not be damaged; and residual noise can be read on the meter during lulls in the program.

### **3.7 DISTORTION MEASUREMENTS**

Connect the distortion analyzer input to the rear-panel UNBALANCED AUDIO OUT at TB2, and tune the analyzer to the fundamental frequency of the audio used to modulate the transmitter. Residual distortion in the Monitor is typically 0.15 percent at 99 percent modulation.

### **3.8 CARRIER POWER ALARM**

The MODULATION/LOSS OF CARRIER ALARM terminals (pins 4 and 5 of TB1) short circuit when the carrier level drops below a preset level. This level is internally adjustable between 0% and 20% below normal level, and is factory set at 10% below normal. There is no front panel control for this feature.

It is emphasized that the CARRIER ALARM terminals are DPDT gold alloy relay contacts. The voltage at the terminals must not exceed +30 volts and the current through the terminals must not exceed 2 amperes.

### **3.9 MODULATION ALARM**

The rear panel MODULATION/LOSS OF CARRIER ALARM terminals (pins 4 and 5 of TB1) short circuit when the modulation on the monitored carrier drops below 10% for a preset period of time. This period is internally adjustable between 2 and 30 seconds. There is no front-panel control for this feature.

## Section IV

### THEORY OF OPERATION

#### 4.1 Block Diagram Description

The modulated carrier to be monitored is brought in through the RF INPUT connector and is adjusted by means of the CARRIER LEVEL potentiometer to 1V rms at the input to the AM detector. This corresponds to the level at which the CARRIER LEVEL "SET" LED is lit. The AM detector is a full-wave rectifier which cancels out the carrier frequency. This provides a wider bandwidth through the lowpass filter to the metering circuit without allowing the carrier to be passed.

The output of the AM detector is a DC voltage, which is proportional to the input carrier level and the audio modulation riding on the DC. This composite signal is fed through the linear phase lowpass filter which eliminates the carrier and its harmonics and does not produce overshoot on square-wave audio or complex music waveforms. The DC out of the filter is amplified to drive the CARRIER LEVEL LEDs. This circuit is factory adjusted so that a 1-volt rms input to the AM detector turns on the SET LED. The amplified DC is also used to activate an external carrier power alarm by providing a relay contact closure when the DC level out of the lowpass filter drops 10% below normal level.

The audio out of the lowpass filter is applied to a voltage-controlled attenuator to keep the modulation meters and flashers calibrated as the RF level varies within  $\pm 30\%$  of the normal level. The attenuator is in a loop with a buffer amplifier and comparator. The buffered DC voltage out of the attenuator is compared with a reference DC voltage, and any difference is applied to the attenuator to correct its DC output. Holding the DC level constant maintains the calibration of the meter and flasher circuits.

The audio output from the buffer amplifier is fed to switch SW1-C to measure positive modulation peaks, and it is also inverted and applied to switch SW1-B to measure negative modulation peaks. Either of these can be selected by the switches for driving the \*MODULATION meters through the meter amplifiers, attenuator circuits, and meter detectors. The adjustable attenuator makes it possible to read audio voltages down to 70 dB below 100% modulation, for measurement of residual noise and hum without an external voltmeter.

The positive and negative modulations are also applied to the Pulsewidth Differential Detector (PMDD). When the front-panel switches are set to from 50% to 150%, they control a DC reference voltage to the detector. This voltage is compared with the + and - modulation audio peaks in the PMDD peak comparator. When the audio peaks reach the value of the reference DC voltage, pulses are generated in the comparator and sent to the PMDD peak flasher (which is a programmed microprocessor), against a pulsewidth duration, Tx, set by a thumbwheel switch. If the incoming pulse is greater than Tx, a 1.5-second high output is generated by the microprocessor to activate a corresponding LED on the front panel. The push-wheel switches can be set in 1% steps from 50% to 150% on both positive and negative peaks.

The +125% peak modulation detector is factory set for 125% on positive peaks only, but can be internally adjustable from 115% to 125%.

The audio from the buffer amplifier is amplified and fed to two standard audio outputs; one (UNBALANCED AUDIO OUT) is 5 volts rms into 5000 ohms, and the other (BALANCED AUDIO OUT) is 0 dBm into 600 ohms.

The calibration circuit consists of a 500 kHz oscillator which simulates a carrier. Modulations of -100% and +125% are digitally generated, and the modulated carrier is fed into the AM detector when the front-panel CAL function switch is depressed. Since the modulation percentage of the calibration signal is precisely determined by the digital circuitry and is independent of the carrier level and carrier frequency, the MODULATION meters and the peak flashers can be calibrated regardless of the reading on the INPUT LEVEL LEDs.

#### **4.2 AM Detector, Lowpass Filter, and Summing Amplifier (Figure 6-5)**

The detector circuit consists of input transformer T2 and diodes CR3 and CR5 in a full-wave rectifier circuit. The diodes are biased to reduce distortion which may occur when modulation approaches 100%. This bias is factory adjusted by means of potentiometer R77, and should not be readjusted in the field unless an AM Generator with distortion less than 0.1% at 99% modulation is available.

U8, U9 and associated components constitute an active, linear phase, Gaussian, lowpass filter. The 3-dB cutoff is at 80 kHz, making it possible to measure all sidebands out to 70 or 80 kHz. The bias on the AM detector diodes adds a DC component to the audio out of the lowpass filter that is not due to the carrier level. To compensate for this, the same bias that is applied to

the detector diodes is also applied to diodes CR6 and CR7. Thus the common-mode input of U10 has the same value as that at the inverting input of U10; and the DC level out of U10 is proportional to carrier level only. Riding on this DC level is an AC voltage proportional to the modulation on the carrier.

#### **4.3 Audio Attenuator (Figure 6-5)**

The composite signal out of summing amplifier U10 drives voltage follower U11 through the voltage divider network consisting of R55, the photo-resistor in optical coupler U17 and R72. Lowpass filter R57/C39 passes only the DC component of the composite signal to the non-inverting input of comparator U11. When this DC voltage is different from the reference voltage set by R61, U11 produces an output which is applied to emitter follower Q9. Current change through the LED of U17 changes the resistance of U17 to apply a change in U11 input voltage which restores the DC output of U11 to its original value. This action ensures that the modulation amplitudes to be measured will not be affected by small changes in the level of the carrier fed into the Monitor.

The level-stabilized composite signal from voltage follower U11 is routed to the meter attenuator/amp U14A via switch SW1C to drive the +MODULATION meter. The U11 output is also inverted by U12 and sent to U15 via switch SW1B to drive the -MODULATION meter. The outputs of U11 and U12 also drive the PMDD (Pulse Modulation Duration Differentiator) circuit.

#### **4.4 Carrier Level LED Drivers (Figure 6-5)**

Op amp U10B doubles the DC voltage component of the composite signal from summing amplifier U10A to drive the Carrier level detector U25. DC voltages set by R129 and R132 provide the reference voltages for HI and LOW LEDs respectively. When the DC component of the composite signal from U10B is within the window of the above reference voltages, the SET LED will light.

#### **4.5 Audio Amplifiers (Figure 6-5)**

The level-stabilized audio signal from U11 is sent to U7A where it is de-emphasized according to the Modified 75 microsecond AM standard de-emphasis curve set up by National Radio Systems Committee (NRSC). The de-emphasized audio signal from U7A is sent to U7B to provide 14V p-p unbalanced output. The balanced output is provided by U7A and U13B.

#### **4.6 Modulation Meter Amplifiers (Figure 6-5)**

The amplified, level-stabilized audio signal from U14A is fed through attenuator R84, R85,

R86, R87 or R88 depending on which Modulation Meter Switch is depressed to the right meter amplifier, consisting of op amps U14A and U18.

The output of this amplifier is rectified by meter detector CR11 to drive the +MODULATION meter through operational amplifier U19, which acts as a buffer and current driver. C82, R114 and R115, together with the meter characteristics, determine the meter fall time, which is between 500 and 800 milliseconds. Meter deflection, rise time, and overshoot are determined by C85, R118, and R120. The values of these components are factory selected for a rise time of 90% of 40 to 90 milliseconds, and an overshoot of less than 7%.

The inverted, level-stabilized audio signal from U12 is fed to the left meter amplifier, U15 via switch SW1/B. The output of U15 is rectified by CR12 to drive the -MODULATION meter through op amp U16. C52, R96 and R98, together with the left meter characteristics, determine the meter fall time. The meter deflection, rise time and overshoot are determined by C56, R102 and R105.

With the CAL function switch and the +MODULATION meter 100% switches depressed, the gain of amplifier U18 is adjusted by R122 to give the +MODULATION meter reading of 125%. The gain of amplifier U15 is adjusted by R1 to give the -MODULATION meter reading of 100%.

#### 4.7 Peak Flashers (Figure 6-5)

Input for the +125% peak mod flasher is the amplified, level-stabilized audio signal from U27A. This is applied to the non-inverting input of comparator U28A. When a modulation peak exceeds the voltage to which calibrating potentiometer R140 is set, a positive pulse is produced at the output of U28A. R140 is normally set to produce an output when positive modulation peaks reach or exceed 125%. The pulse generated by U28A is then sent to U31 against a pulse width duration, Tx, set by the thumbwheel switch SW2. Usually, Tx is set by factory to 0.1 millisecond. If the incoming pulse is greater than 0.1 millisecond, a 1.5 second high output is generated by U31 and sent to Q16 to activate the front panel +125% PEAK MODULATION LED.

The amplified, level-stabilized + and - modulation signals from U27A and U27B are sent to PMDD peak comparators U28B and U28D respectively. These signals are compared in U28B and U28D with a reference DC voltage supplied by U29, U33, U32, and U31. Its value is controlled by push-wheel switches on the front panel according to Table 1 in Figure 6-5, Sheet 2.

The reference DC voltage is then compared in U28B and U28D with the + and - modulation audio

signals respectively. When the modulation amplitude exceeds the reference voltage, U28B and U28D will produce output pulses. These pulses are then sent to U31 against Tx. If the incoming pulses are greater than 0.1 millisecond, 1.5 second high outputs are generated by U31 and sent to Q17 and Q18 to activate the + and - % PEAK MODULATION LEDs respectively.

#### **4.8 Calibration Signal Generator (Figure 6-5)**

The purpose of the calibration signal generator is to produce a signal that simulates an RF carrier precisely modulated 125% positively and 100% negatively. Q4 and Q5 form a 0.6 MHz free-running multivibrator. Flip-flop U3B divides the frequency by 2 to give a 300 kHz input to pin 1 of NAND gate U1. The circuitry consisting of divider chain U4/U5, gate U2, and flip-flop U3A, driven by the output of U3B, produces an asymmetrical output. This output is applied to pin 2 of U1; thus the gated output at pin 3 of U1 is a 300 kHz signal gated alternately on and off. This provides the required +125%, -100% modulation. Calibration accuracy is not dependent on accuracy of the oscillator frequency, but only on the accuracy of the digital divider circuit that generates the asymmetrical waveform.

The output of U1C is amplified to approximately 1 volt rms by the push-pull circuit consisting of Q1, Q2, Q3 and T1. When the CAL function switch is depressed, this calibration signal replaces the monitored signal as the input to the AM detector.

#### **4.9 Power Supplies (Figure 6-5)**

The 26-volt center tapped secondary of the power transformer is connected to bridge rectifier U20. U20 supplies a positive output to regulator U22 which provides a +12 volt output. U20 also provides a negative output to regulator U23 which provides a -12 volt output. There are no adjustments on the power supplies.

The 13-volt AC output from the transformer also furnishes current for two pairs of 12-volt modulation meter lamps.

Another center -tapped secondary of the power transformer is connected to two full-wave rectifiers, CR13 and CR14. Together they supply a positive output to regulator U21, which provides a +5 volt output.

## Section V

### MAINTENANCE

#### 5.1 GENERAL INFORMATION

Since the Model 923 is an all solid-state instrument, very little maintenance is required. The Model 923 should be installed a sufficient distance from high heat-producing instruments to insure an ambient operating temperature below  $+50^{\circ}\text{C}$  ( $+122^{\circ}\text{F}$ ). Access to the unit is via the top panel which is held in by seven sheet metal screws. The printed circuit board is removed by following steps a through d below. Re-assembly is by reverse order.

- a. Remove top cover by removing the seven sheet metal screws that secure it to the unit.
- b. Remove the front panel assembly, four 6-32 screws and handles, and disconnect cable plugs from the PC board.
- c. Remove nine 6-40 screws.
- d. Remove the board from the hold-downs by lifting the board.

#### 5.2 PERIODIC MAINTENANCE

The only periodic maintenance that should be required is to remove excess dust accumulation on an annual basis. This is done by removing the seven sheet metal screws holding the top cover, and blowing the dust out with compressed air.

#### 5.3 METER LAMP REPLACEMENT

Access to the meter lamps is through the top panel after removing the seven sheet metal screws securing the top panel.

#### 5.4 CALIBRATION PROCEDURES

The following calibration procedures are intended for the person having a RF generator capable of very low distortion amplitude modulation and whose level can be accurately controlled. A high input impedance digital voltmeter and an oscilloscope are also necessary.

##### 5.4.1 Audio Attenuator Circuit

Connect the input of a digital voltmeter to the wiper of R61 and adjust R61 for 0.500 VDC. Connect a 1 V rms RF signal at the desired frequency to the RF input and turn the RF

level control until the SET LED is on. Measure the D.C. Voltage at TP5, which should be 2.0 Volts  $\pm 0.1$  Volts. Measure the D.C. voltage at TP4, which should be 0.500V  $\pm 0.010$  Volts D.C. Changing the RF input by  $\pm 3$  dB without re-adjusting the RF level ADJ will temporarily change this voltage, but it should return to 0.500V within 5 seconds. If this occurs, the audio attenuator circuitry is working properly.

#### **5.4.2 Carrier Level Indicators**

With a 1 Vrms RF Carrier present at the input to the Model 923 adjust the INPUT LEVEL control so that the INPUT LEVEL "SET" LED is on.

#### **5.4.3 Peak Flashers**

Amplitude modulate the RF generator to 98% using a 400 Hz audio signal. Set the pushwheel switches on the Model 923 to 98%. The + and - PEAK MODULATION indicators should be ON. Adjust R145 and R151 for proper operation. Reduce the modulation to 95% and the + and - % PEAK MODULATION indicators should be OFF. Press the CAL FUNCTION button and set the pushwheel switches to 100%. Both of + and - % PEAK MODULATION indicators and the "125%" indicator should be ON. Slowly vary R140 (+125% PEAK ADJ) to make sure the "125%" indicator is just coming ON.

#### **5.4.4 Modulation Meter**

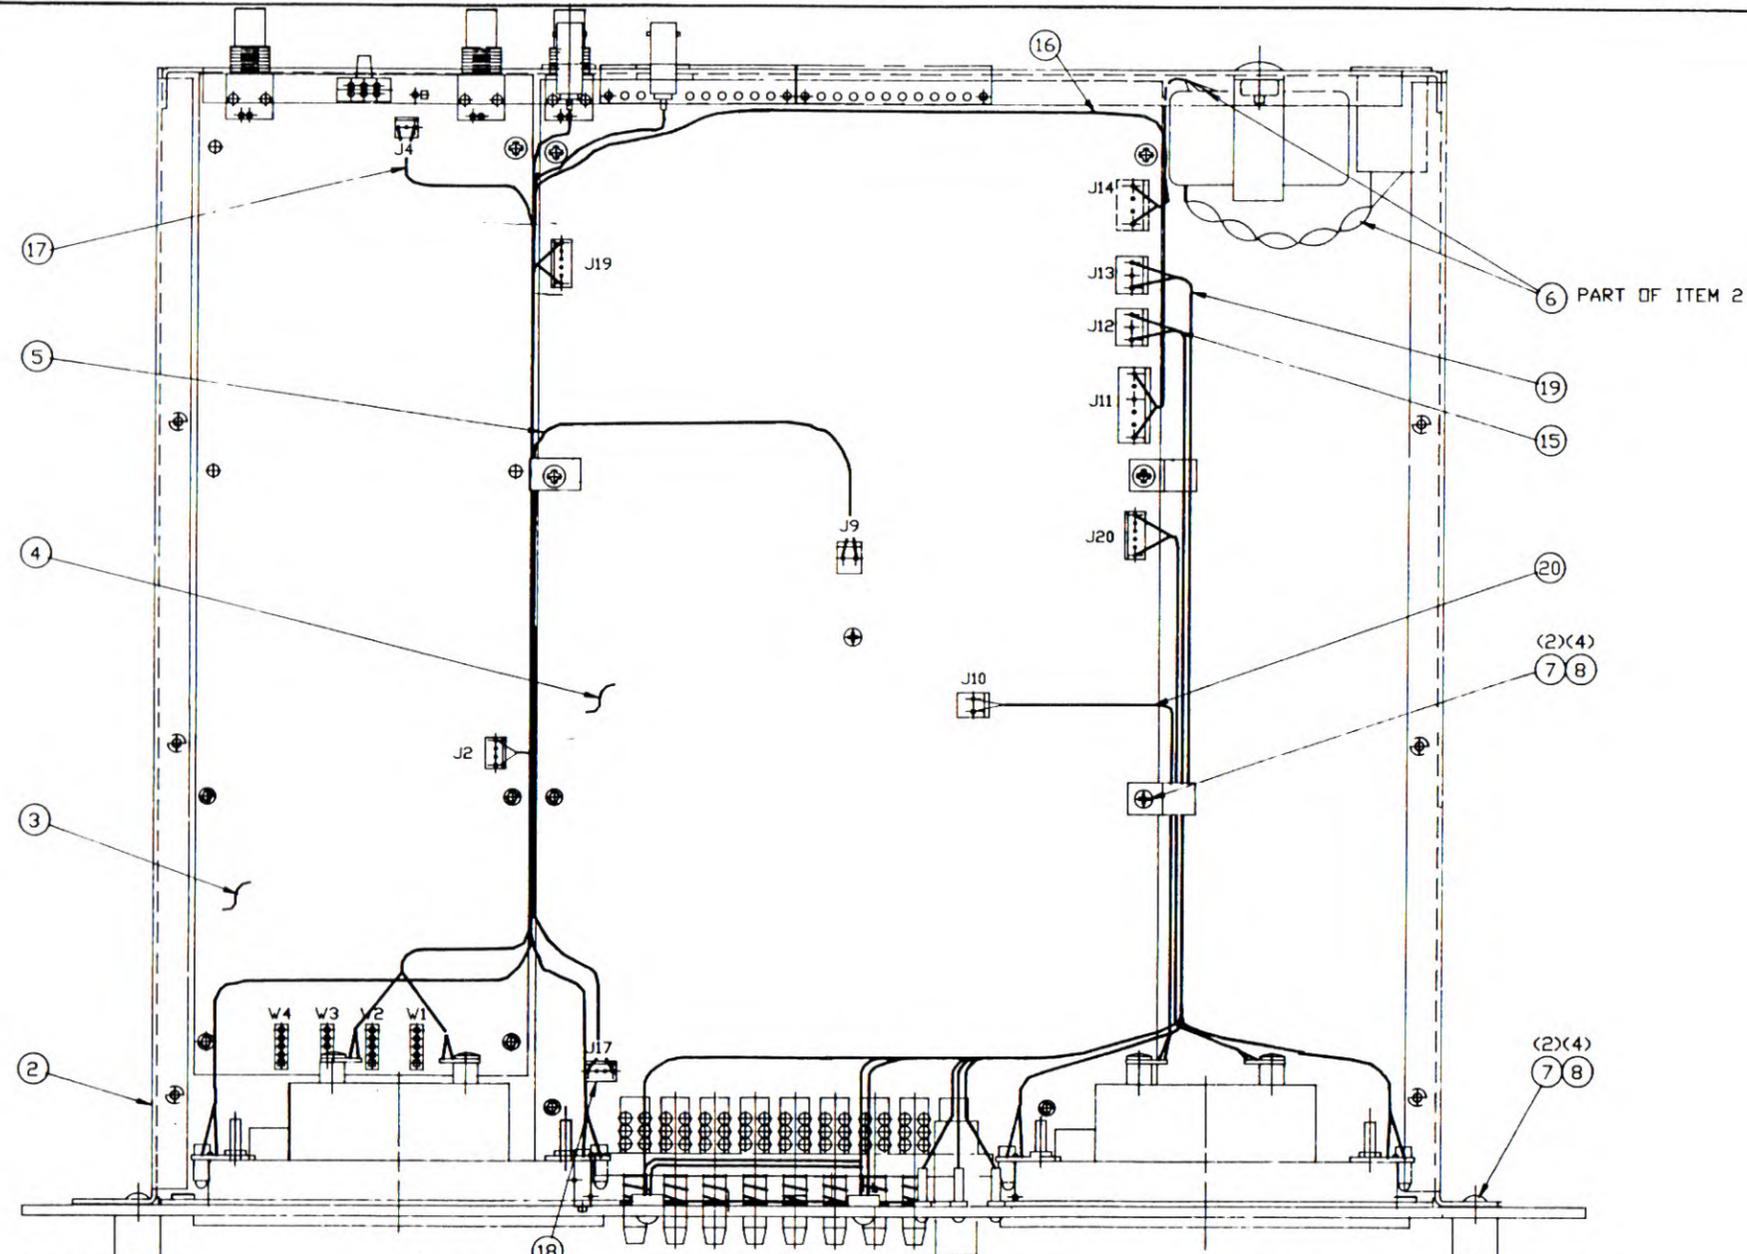

Amplitude modulate the RF generator to 100% with a 400 Hz audio signal. Both the - MODULATION and + MODULATION meters on the 923 should read 100% with the 0 dB (100%) attenuator button depressed. Adjust the METER CAL controls if necessary. Press the CAL FUNCTION button. The -MODULATION meter should read 100%  $\pm 1\%$  and the +MODULATION meter should read 125%  $\pm 2\%$ .

#### **5.4.5 Carrier Power Alarm**

With the carrier level indicator at the SET mark, the loss of carrier alarm output, the circuit between pin 4 and pin 5 of TB2 on the rear panel, should be OFF (open). Decrease the RF level 10%, and the output should be ON (shorted). Adjust R28 for the -10%.

#### **5.4.6 Modulation Alarm**

With 10% modulation or less the modulation alarm output, circuit between pin 4 and 5 of TB2 on the rear panel should be ON (shorted). R20 controls the delay between loss of modulation and the alarm going ON.

### GENERAL INFORMATION

#### A1.1 EQUIPMENT DESCRIPTION

The TFT Model 923 RF Preselector is a circuit board intended for installation in the TFT Model 923 AM Modulation Monitor to enable off-the-air measurement of the modulation percentage of a selected transmitter carrier in the frequency range of 500 kHz to 1.99 MHz. The RF Preselector is configured as a double-conversion superheterodyne receiver front-end with a 455 kHz IF output. Tuning is done by entering the desired receive frequency into a 4-digit push-wheel switch. Frequency resolution is 1 kHz. Figure A1.1-1 is a block diagram of the RF Preselector.

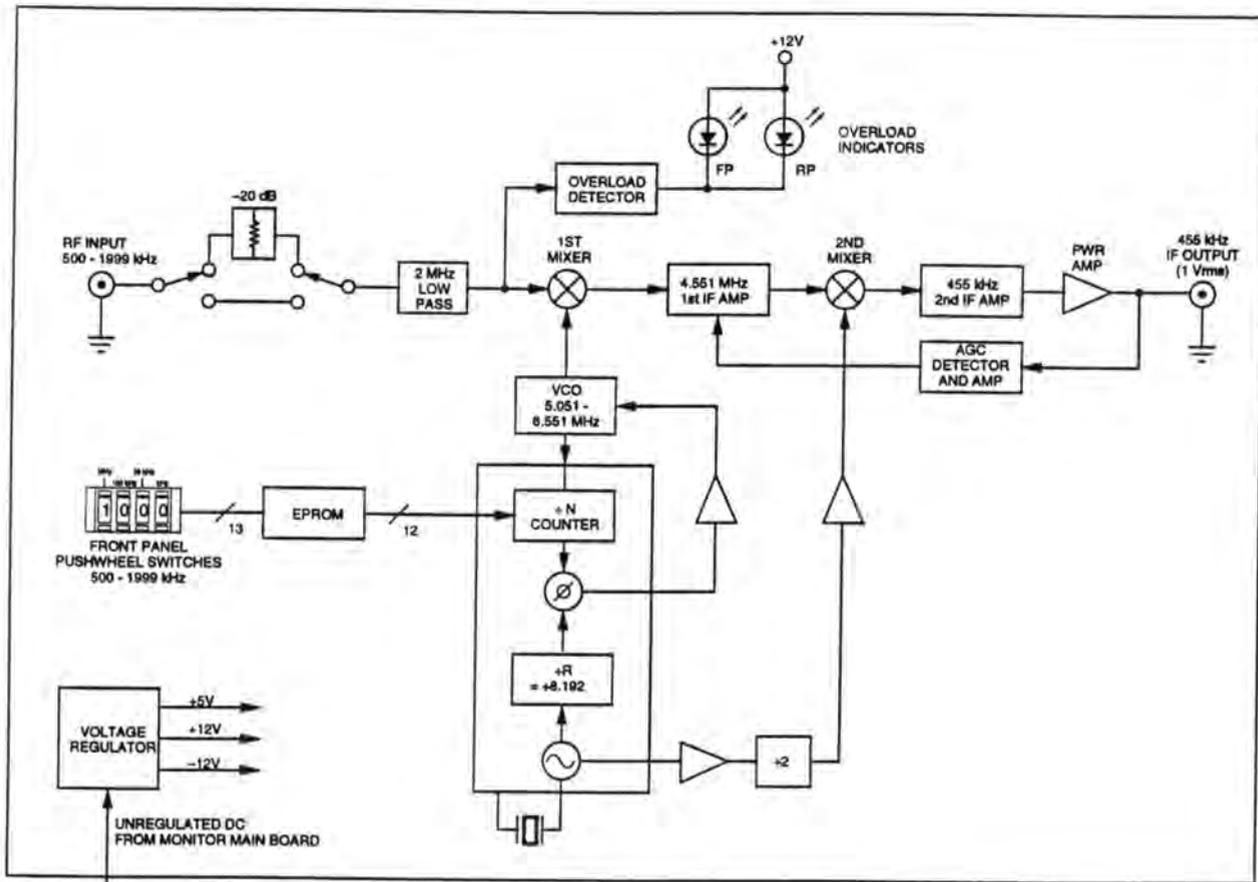

Figure A1.1-1. RF Preselector - Block Diagram

## A1.2 SPECIFICATIONS

Frequency Range . . . . .	500 kHz to 1.99 MHz
RF Sensitivity . . . . .	100 $\mu$ V for 40 dB SNR; 1 mV for 55 dB SNR below 100% modulation
Input Impedance . . . . .	50 ohms (nominal)
Tuning . . . . .	4-digit pushwheel switch; 1 kHz resolution.
IF Bandwidth . . . . .	$\pm$ 40 kHz, 40 dB.
Image Rejection Ratio . . . . .	> 60 dB
AGC Range . . . . .	54 dB (100 $\mu$ V to 50 mV)
Output . . . . .	455 kHz, 1Vrms into 50 ohms
Power Requirement . . . . .	115/230 VAC 50/60 Hz, 15 watts max.
Operating Temperature . . . . .	0°C to 50°C

### **A1.3 WARRANTY**

TFT Inc., warrants each of the instruments of its manufacture to be produced to meet the specifications delivered to the BUYER; and to be free from defects in material and workmanship and will repair or replace, at its expense, for a period of one year from the date of delivery of equipment, any parts which are defective from faulty material or poor workmanship.

Instruments found to be defective during the warranty period shall be returned to the factory with transportation charges prepaid by BUYER. It is expressly agreed that replacement and repair shall be the sole remedy of BUYER with respect to any non-conforming equipment and parts thereof and shall be in lieu of any other remedy available by applicable law. All returns to the factory must be authorized by the SELLER, prior to such returns. Upon examination by the factory, if the instrument is found to be defective, the unit will be repaired and returned to the BUYER, with transportation charges prepaid by SELLER.

Transportation charges for instruments found to be defective within the first (30) days of the warranty period will be paid both ways by the SELLER.

Transportation charges for warranty returns, wherein failure is found not to be the fault of the SELLER, shall be paid both ways by the BUYER.

This warranty does not apply to instruments which, in the opinion of the SELLER, have been altered or misused.

**NO OTHER WARRANTY IS EXPRESSED OR IMPLIED. TFT IS NOT LIABLE FOR CONSEQUENTIAL DAMAGES.**

### **A1.4 CLAIMS FOR DAMAGE IN SHIPMENT**

Your instrument should be inspected and tested as soon as it is received. The instrument is insured for safe delivery. If the instrument is damaged in any way or fails to operate properly, file a claim with the carrier, or if insured separately, with the insurance company.

**WE SINCERELY PLEDGE OUR IMMEDIATE AND FULLEST COOPERATION TO ALL USERS OF OUR PRECISION ELECTRONIC INSTRUMENTS.**

**PLEASE ADVISE US IF WE CAN ASSIST YOU IN ANY MANNER**

**TFT, Inc.  
3090 Oakmead Village Drive  
Santa Clara, CA 95051**

## Section A2

### INSTALLATION

#### A2.1 Unpacking and Inspection.

Upon receiving the instrument, inspect the packing box and instrument for signs of possible shipping damage. Operate the instrument in accordance with the procedures of Section A3 of this manual. If the instrument is damaged or fails to operate properly, file a claim with the transportation company, or with the insurance company if insured separately.

#### A2.2 Power Requirements.

The RF Preselector derives its power from a 115/230 VAC source, 50 to 60 Hz, and requires 15 volt-amperes.

#### A2.3 Installation and Connections.

When the Model 923 RF preselector option is ordered with the Model 923 Monitor, the Preselector is factory installed in the same chassis as the Monitor. Only two connections are required:

- a. Connect the 455 kHz OUTPUT connector at the rear of the RF Preselector to the HIGH LEVEL RF INPUT connector at the rear of the Monitor with the short coax cable provided.
- b. Connect a rooftop antenna to the ANT INPUT connector at the rear of the RF Preselector. Where a strong signal can be expected (greater than 4 mV/meter), a Resonant Loop Antenna can be used, (see Fig. 2-1). In low signal locations, a long wire (approximately 200 feet) can be used with good results. When the Resonant Loop Antenna is used, connect the antenna to the Preselector with a 50-ohm coaxial cable. When a long wire is used, connect it directly to the ANT INPUT connector of the RF Preselector; a 51-ohm resistor should also be connected from the input to chassis ground.

When the Preselector is located in a very strong RF field, it is recommended that a notch filter be constructed and installed between the antenna and the ANT input of the Preselector. The circuit of Figure 2-2 provides a 20-dB notch at the frequency determined by L and C, with 6 dB attenuation at the other frequencies.

#### **A2.4 Field Installation of RF Preselector Board**

- a. Remove top cover from the instrument
- b. Remove front panel.
- c. Install the RF Preselector Board (Figure 6-1, Item 3) onto standoffs, using eight No. 6, 3/8-inch screws.
- d. Connect the coaxial cable from rear-panel 455 kHz OUTPUT connector to the HIGH LEVEL RF INPUT connector on the Main Board.
- e. Install the front panel. Make sure that the overload LED (CR3) protrudes through the OVERLOAD hole in the rear panel.
- f. Install the 4-digit pushwheel switch assembly to the front panel using four No 4 nuts.
- g. Install the enclosed LED cable assembly (Figure 6-1, Item 17) to the front panel. Plug the cable into J4 on the RF Preselector board.
- h. Plug the 4-pin connector on the cable assembly (Figure 6-1, Item 16) into J14 on the main board and J2 on the Preselector board.
- i. Reinstall the top cover onto the instrument.
- j. Refer to Section A2.3 for external connections.

## Section A3 OPERATION

### A3.1 General Information

The RF Preselector enables off-the-air operation of the Model 923 AM Modulation Monitor. After installation of the RF Preselector, the only change in operation of the Modulation Monitor is the entry of the desired monitor frequency via a front panel 4-digit pushwheel (Figure A3.3-1, Item 9).

### A3.2 Turn-on and Warm-up

The RF Preselector has no on-off switch. It derives its operating power (3 levels of unregulated DC) from the Model 923 AM Modulation Monitor power supply and so is ON whenever the Model 923 AM Modulation Monitor is plugged into an appropriate power source. The RF Preselector requires only a 1-minute warm-up before it is ready for use.

### A3.3 Controls, Indicators and Connectors

Model 923 AM Modulation Monitor Front and rear panel controls, indicators and connectors are shown in Figures A3.3-1 and A3.3-2. The functions of these items are listed in Tables A3.3-1 and A3.3-2.

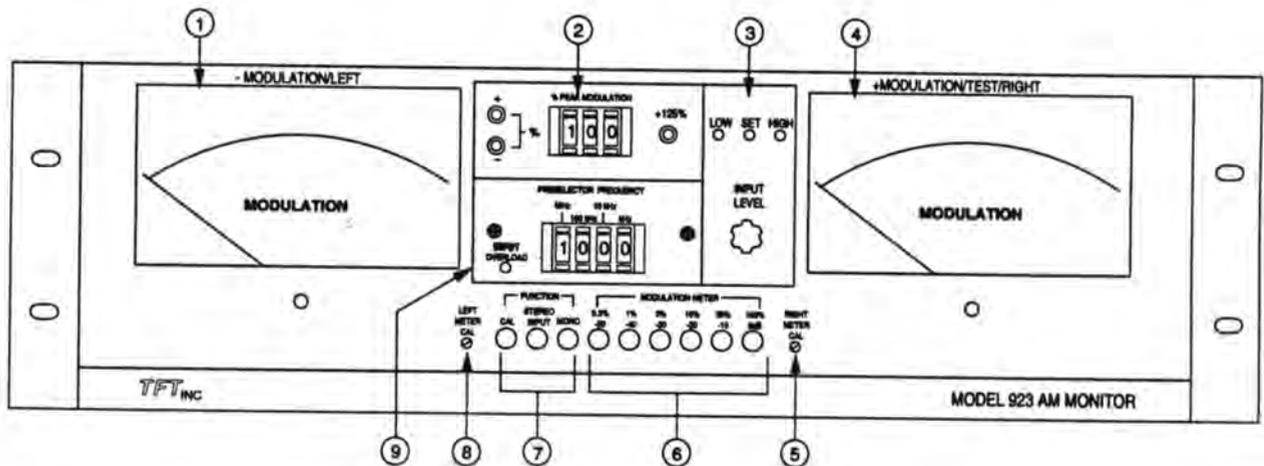

Figure A3.3-1. AM Monitor Front Panel Controls and Indicators

Table A3.3-1. AM Monitor Front Panel Controls and Indicators

ITEM	NAME	FUNCTION														
1	-MODULATION/LEFT	Analog meter. Indicates negative modulation percentage of carrier being monitored as described in Section 3.4.														
2	% PEAK MODULATION	<p>3-digit pushwheel switch and 3 LEDs. Used to indicate that a modulation peak has exceeded a reference level selected via the MODULATION METER switches (Item 6).</p> <p>The LEDs can respond to fast transients and peaks that the MODULATION meters cannot.</p> <p>The pushwheel switches should be set to the desired modulation reference modulation percentage. The <math>\pm</math> % LED pair will then flash when modulation peaks exceed the selected reference.</p> <p>The + 125% LED will flash when modulation exceeds 125% regardless of the setting of the pushwheel switches.</p>														
3	INPUT LEVEL	<p>Three LED indicators and one potentiometer control. Used to adjust the carrier input level from the transmitter as described in Section 2.3. The indicator can also be used to observe changes in carrier power during modulation. SET LED lights when input signal level is correct. LOW LED lights when input level is too low. HIGH LED lights when input level is too high.</p>														
4	+ MODULATION/TEST/ RIGHT	<p>Analog meter. Indicates positive modulation percentage of carrier being monitored as described in Section 3.4. The scale to be read depends on which MODULATION METER attenuation switch (Item 6) is depressed, as follows:</p> <table border="0"> <thead> <tr> <th>Modulation Meter Switch</th> <th>Applicable Meter Scale</th> </tr> </thead> <tbody> <tr> <td>100% (0 dB)</td> <td>Top scale</td> </tr> <tr> <td>30% (-10)</td> <td>Middle scale</td> </tr> <tr> <td>10% (-20)</td> <td>Top scale + 10</td> </tr> <tr> <td>3% (-30)</td> <td>Middle scale + 10</td> </tr> <tr> <td>1% (-40)</td> <td>Top scale + 100</td> </tr> <tr> <td>0.3% (-50)</td> <td>Middle scale + 100</td> </tr> </tbody> </table> <p>The + MODULATION meter is also use to indicate residual noise, as described in Sec.3.6. Residual noise in dB referenced to 100% modulation is the sum of the reading on the lower meter scale and the dB label on the depressed MODULATION METER switch.</p>	Modulation Meter Switch	Applicable Meter Scale	100% (0 dB)	Top scale	30% (-10)	Middle scale	10% (-20)	Top scale + 10	3% (-30)	Middle scale + 10	1% (-40)	Top scale + 100	0.3% (-50)	Middle scale + 100
Modulation Meter Switch	Applicable Meter Scale															
100% (0 dB)	Top scale															
30% (-10)	Middle scale															
10% (-20)	Top scale + 10															
3% (-30)	Middle scale + 10															
1% (-40)	Top scale + 100															
0.3% (-50)	Middle scale + 100															

Table A3.3-1. AM Monitor Front Panel Controls and Indicators (Continued)

ITEM	NAME	FUNCTION
5	RIGHT METER CAL	Screwdriver-adjust potentiometer. Used for calibrating + MODULATION meter as described in Section 3.4.
6	MODULATION METER	Set of six interlocked pushbutton switches. Each switch selects an attenuator to set the scale of the + MODULATION/TEST/RIGHT meter (Item 4)
7	FUNCTION	
8	LEFT METER CAL	Two interlocked pushbutton switches (MONO and STEREO INPUT) and one alternate-action pushbutton switch (CAL) used as follows:  <b>MONO</b> Used for monitoring AM Monaural broadcast programs only.  <b>STEREO INPUT</b> Reserved for future use.  <b>CAL</b> On-off control of modulation calibrator. Use of the calibrator is explained in Section 3.5.
9	PRESELECTOR FREQUENCY	Screwdriver-adjust potentiometer. Used for calibrating -MODULATION meter as described in Section 3.4.
		4-digit pushwheel switch and LED. Pushwheel switch is for entering desired monitor frequency.  <b>PEAK OVERLOAD LED</b> lights when RF input is too high for proper operation. RF input level can be reduced by 20 dB by changing position of HI/LOW SELECTOR switch on rear panel from LOW to HI.

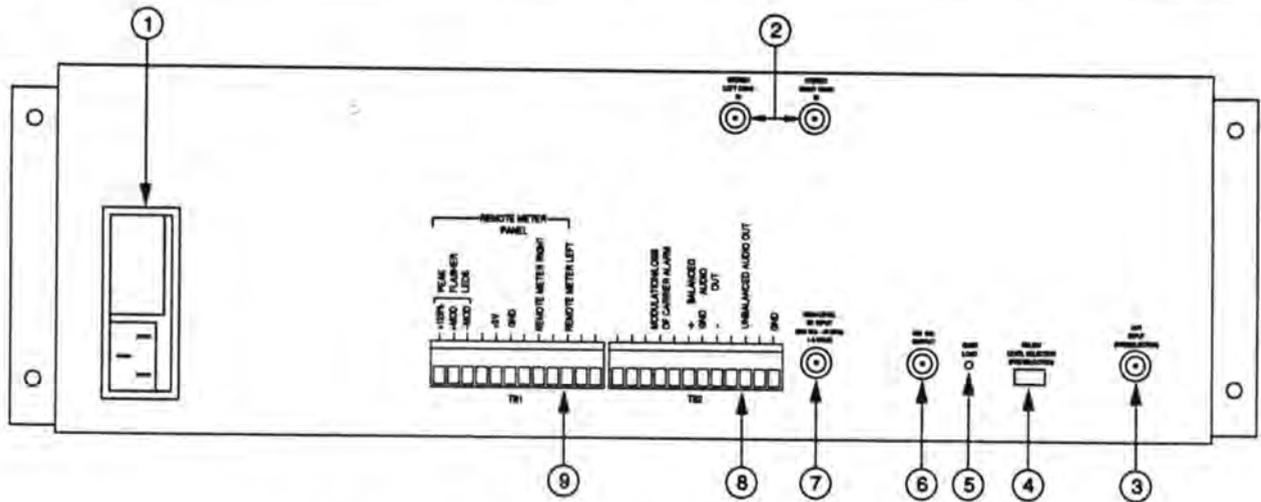

Figure A3.3-2. AM Monitor Rear Panel Controls and Connectors

Table A3.3-2. AM Monitor Rear Panel Controls and Connectors

ITEM	NAME	FUNCTION
1	(none)	Houses the power fuse, power line noise filters and input voltage selector for 115 or 230VAC.
2	STEREO LEFT CHAN IN RIGHT CHAN IN	TWO BNC input connectors reserved for future use.
3	ANT INPUT (PRESELECTOR)	BNC Connector. Used to connect an antenna to the RF Preselector when this option is installed.
4	HI/LOW LEVEL SELECTOR (PRESELECTOR)	2-position slide switch. Effective only with RF Preselector is installed. In the HI position, a 20 dB attenuator is inserted in the input line. LOW position is for RF input levels of 0.1 to 10 mVrms. HI position is for RF input levels of 10 to 50 mVrms.
5	OVERLOAD	LED. Effective only when RF Preselector is installed. Lights when RF input is too high for proper operation. The RF input level can be reduced by 20 dB by changing position of the HI/LOW Selector (Item 4) to HIGH.
6	455 kHz OUTPUT	BNC connector. Used to connect RF Preselector output to Model 923 RF input.
7	HI-LEVEL RF INPUT 500 kHz - 40 MHz 1-5 VRMS	BNC Connector: Provides a means for introducing transmitter carrier through a 50-ohm cable. Maximum voltage is 5 Vrms.
8	TB2	12-pin connector. Carries the following outputs:  <b>Loss of Carrier Alarm.</b> When RF input drops below a preset level, this pair of terminals provides contact closure that can handle up to 2 amperes at up to 28 VDC.  <b>Modulation Alarm.</b> When the modulation on the monitored carrier drops below 10% for a preset time period, this pair of terminals provides contact closure that can handle up to 2 amperes at up to 28 VDC.  <b>Balanced Audio Output.</b> These terminals provide 2.2 Vp-p modified 75 $\mu$ sec AM Standard de-emphasized, balanced audio output across a 600-ohm load.  <b>Unbalanced Audio Output.</b> This pair of terminals provides 14 Vp-p, modified 75 $\mu$ sec AM Standard de-emphasized unbalanced audio output across a 5 k-ohm load.
9	TB1	12-pin connector. Provides flashers and metering data for future Remote Meter Panel

#### **A3.4 RF Preselector Operation**

- a. Set the 4-digit pushwheel switch to the frequency of the carrier to be monitored.
- b. For 0.1 to 10 mVrms RF input level, set the HIGH/LOW SELECTOR to the LOW position. For 10 to 50 mVrms RF input level, set the HIGH/LOW SELECTOR to HIGH.

#### **A3.5 Use of RF Preselector with Model 923 AM Monitor**

When the RF Preselector is operated as described in Section A3.4, the SET LED should be ON. If it is not, adjust the INPUT LEVEL control on the front panel of the 923 AM Monitor. When changing stations on the RF Preselector, the equipment may require 5 to 10 seconds to return to the set mark on the Model 923 INPUT LEVEL indicators.

The calibration procedure for the Model 923 AM Monitor is not affected by the setting of any of the RF Preselector controls.

For information on the operation of the Model 923 AM Monitor, refer to this instruction manual, Section III.

## SECTION A4

### THEORY OF OPERATION

#### A4.1 Block Diagram Discussion (Figure 6-1).

The RF Preselector is a double-conversion superheterodyne receiver. The incoming RF signal is first passed through a 50-ohm, 20dB attenuator to reduce very strong signals that would overload the first mixer. It is then passed through a 2 MHz lowpass filter and upconverted to 4.551-MHz, thus eliminating the need for a tuned RF stage to reject images. The 4.551 MHz IF is then downconverted to the standard 455-kHz IF, where most of the band shaping is done, then amplified and fed to the output connector. An AGC circuit controls the gain of the first IF amplifier to maintain an output level of 1 volt rms at the rear-panel.

The local-oscillator input for both mixers is derived from an 8.192-MHz crystal oscillator. Its output is divided by 2 to obtain a 4.192 MHz signal as the LO input to the 2nd mixer.

The 8.192-MHz output is also divided by 8192 to obtain a 1-kHz signal which is used to phase-lock a synthesized LO in 1 kHz steps between 5.051 MHz and 6.551 MHz. The synthesizer consists of a divide-by-N phase-locked loop which locks the frequency of a voltage-controlled oscillator with the same accuracy as the 8.192MHz crystal oscillator. The 4-digit pushwheel switch on the front panel permits setting the oscillator frequency 4.551 MHz above the desired RF, for use as the LO input to the first mixer.

An overload detector at the input to the first mixer lights the PEAK OVERLOAD LED whenever the incoming signal exceeds 10 mV. By reducing the input signal level at the first mixer to less than 10 mV with the 20 dB attenuator, intermodulation distortion caused by other AM stations is held to a minimum.

#### A4.2 Lowpass Filter and Overload Detector (Figure 6-3).

The input 2-MHz lowpass filter, consisting of L1, L2 and associated capacitors, provides more than 60 dB image rejection. With the upconversion scheme used, all incoming signals capable of producing image interference are above 9 MHz, and so are rejected.

The output of overload detector CRI is compared in operational amplifier U1 with a fixed voltage which is factory adjusted so that any input signal greater than 10 mV drives the op amp output low to turn on OVERLOAD LEDs CR2 and CR3.

### 4.3 Time Base and Local Oscillator (Figure 6-3).

The RF Preselector time base consists of a 8.192-MHz crystal oscillator. The local oscillator for first mixer Z1 is a voltage controlled oscillator (VCO) (Q1) in a phase-locked loop. The VCO frequency is buffered by Q2 and Q4, and divided down to 1 kHz in a programmable divide-by-N circuit within U6. The resultant 1 kHz signal is compared in the phase detector within U6 with the 1-kHz reference obtained from the time base, as described in the preceding paragraph. The phase detector then produces  $\emptyset R$  &  $\emptyset V$  outputs at pins 8 and pin 9 respectively. They are filtered, combined and amplified by a loop amplifier U7 and its associated components to produce a loop-error signal which is a DC voltage. This DC voltage is applied to varactor diodes CR9 and CR10 to tune the VCO in a direction to reduce the phase difference to zero. The VCO output at the collector of buffer Q2 is fed to the local-oscillator input (pin 8) of mixer Z21 through emitter follower Q3.

The value of N for the divide-by-N circuit is selected to provide a 1-kHz input to the phase detector when the VCO frequency is 4.551 MHz above the frequency dialed in on the 4-digit pushwheel switch.

### A4.4 First Mixer and 4.551-MHz IF Amplifier (Figure 6-3)

The 1st mixer Z1 is a doubly balanced ring modulator for good intermodulation distortion. The incoming RF signal is applied to pin 1, and the LO is applied at pin 8. The difference product of the LO and RF is 4.551 MHz and is amplified by the 4.551 MHz IF chain consisting of two dual-gate MOSFETs Q5 and A6. Dual-gate MOSFETs are used for low noise and wide dynamic range (i.e. low intermodulation distortion). Tank circuits consisting of L4, L5 and L6 are sync. tuned to 4.551 MHz

### A4.5 Second Mixer, 455-kHz IF Amplifier, and AGC (Figure 6-3).

The second mixer, U2, is an active mixer. The 4.551-MHz first IF is applied to pin 1. The 455-kHz output appears at both pin 12 and pin 6. From pin 6, it goes through a wide-band IF filter-amplifier. The filtered and amplified output is amplified by Q8, Q9, and Q10 to furnish the RF Preselector output of 1 volt rms at J3.

The output of amplifier Q8/Q9 is also fed back to AGC detector CR6. Its DC output controls the gain of 1st IF amplifier Q5 and Q6 to maintain a constant RF Preselector output. The AGC voltage is adjusted by R54 for an RF Preselector output level of 1 volt RMS.

The 455-kHz IF Filter-Amplifier contains a 455-kHz multi-element ladder wide-band filter (FL1), and a two-stage amplifier (U3-1 and U3-7).

#### **A4.6 Power Supply**

The RF Preselector does not have its own power supply. The +5V, +12V and -12V are derived from corresponding unregulated DC outputs from the power supply on the AM Monitor Main Board by a cable assembly and regulated by U9, U11, and U14, respectively.

## SECTION A5 MAINTENANCE

### A5.1 General

Since the RF Preselector is a solid-state instrument and its power requirement is low, no maintenance problems due to high temperature should be encountered, provided the instrument is installed far away from vacuum-tube and other heat-generating equipment. Likewise, because the operating voltages are low, excessive dust accumulation associated with high-voltage devices should not occur.

Access to components and periodic maintenance are covered in Sections A5.2 and A5.3. Receiver performance checks are covered in Section A5.4.

Refer to the Model 923 AM Monitor instruction manual for maintenance procedures pertaining to the AM Modulation Monitor.

### A5.2 Access

To gain access to the RF Preselector components, remove eight screws from the top cover and then remove the cover.

To remove PC boards and other assemblies from the chassis, proceed as follows:

- a. Remove the four screws holding the front panel to the chassis.
- b. Remove the eight screws that hold the PC board to the standoffs mounted on the chassis. See Figure 6-1 for location of screws.
- c. Remove the four No. 4 nuts that hold the 4-digit pushwheel switch assembly to the front panel. Then separate this switch assembly from the front panel.
- d. Remove the front panel.
- e. Unplug two cables attached to the PC board.
- f. Pull out the PC board.

### A5.3 Periodic Maintenance

The only periodic maintenance required is cleaning. Once a year, or more often in dusty locations, remove the printed-circuit boards and blow off the dust with compressed air.

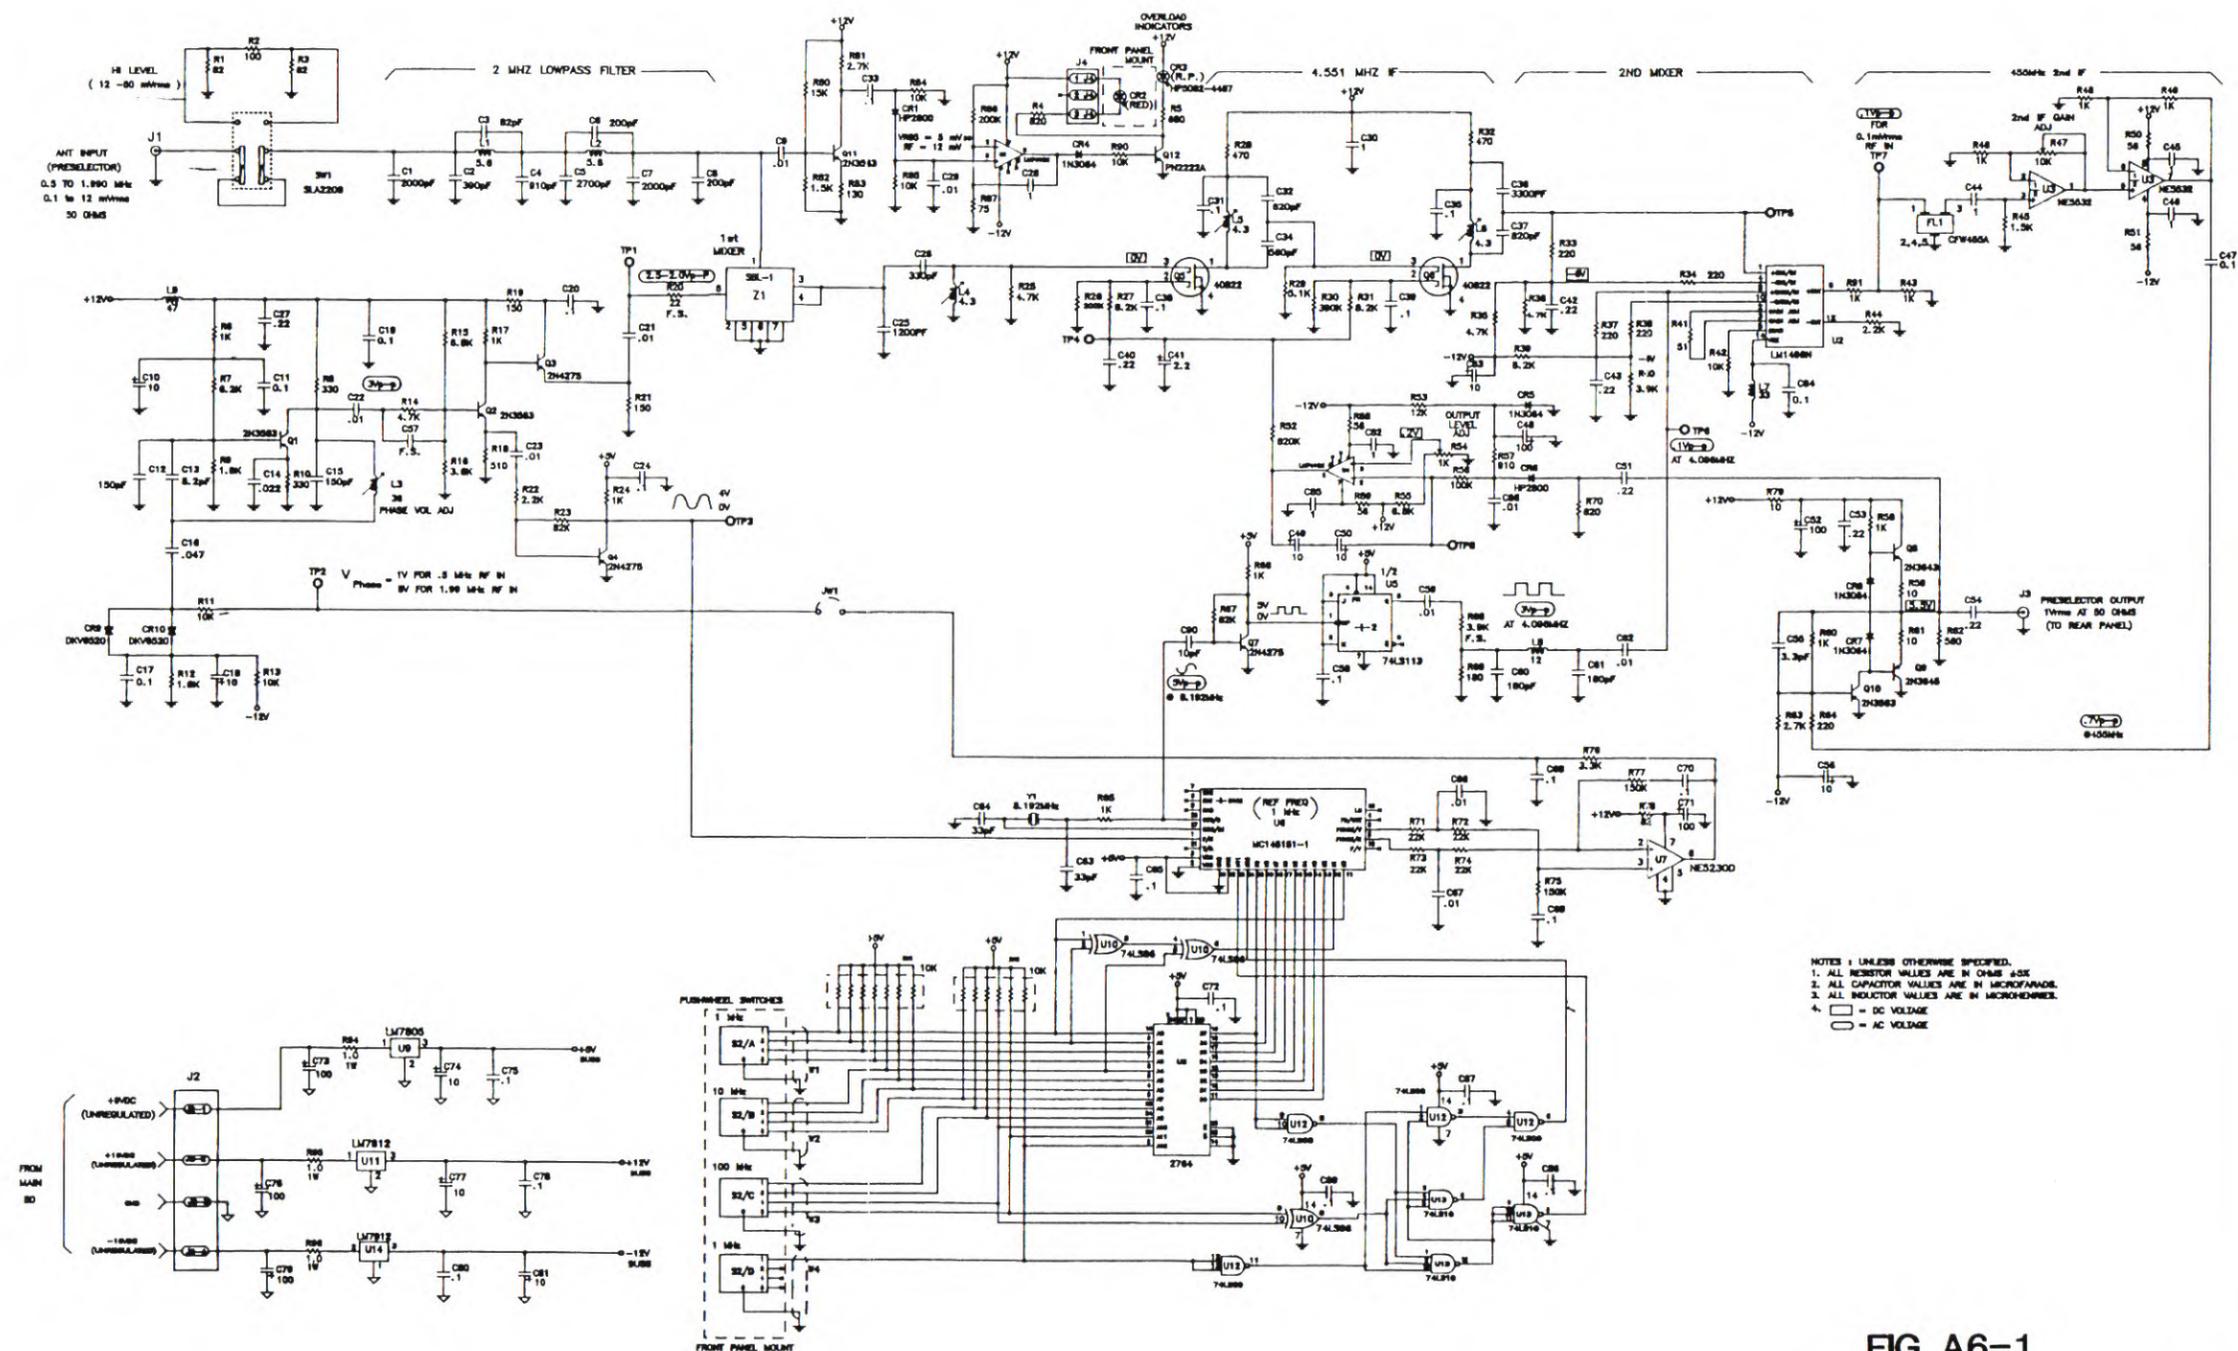

#### **A5.4 Receiver Performance Checks.**

To determine whether the receiver circuits of the RF Preselector are operating satisfactorily, proceed as follows:

- a. Connect the output of an appropriate signal generator to the rear panel ANT INPUT connector, and set the signal generator and tune the RF Preselector and the Signal Generator to the same frequency in the band from 500 to 1900 kHz.
- b. Set the RF LEVEL HIGH/LOW SELECTOR on the RF Preselector rear to the LOW position (minimum attenuation).
- c. Adjust the signal generator output to a minimum, and then increase the output until the carrier level indicators on the 923 AM Monitor come up to the SET mark. The signal generator output for this condition should be 100 microvolts or less. (Make sure the R.F. attenuator on the 923 AM Monitor is at or near its minimum attenuation position).
- d. With no modulation on the signal from the signal generator, and the output level set for 100 microvolts, the residual noise measured by the Model 923 AM Monitor should be less than 40 dB. (Refer to the Model 923 instruction manual section 3.6 for the method of measuring residual noise.)
- e. Increase the signal generator output to 1 millivolt. The residual noise should drop to less than 55 dB.

If the Receiver circuits pass this test, the RF Preselector is operating satisfactorily.
